Lesson 8

Managing dates and time with the spreadsheet

Università
Bocconi
MILANO

Objectives of the lesson

Understand how to manage dates and times in Excel and how to use the related functions

Our first case

In the **Date-Time functions** worksheet we have samples of dates and times to use for an overview of Date & Time functions. We need to:

- Calculate dates and times according to the requests in the worksheet, Date & Time functions

Our second case

In the **Stationery** worksheet we have a sample of the online sales of a stationery wholesaler. We need to:

- Calculate, in a new column named **Days for shipping**, how many days passed between the sale date and time and the shipping date and time, for each sale.
Note: if no shipping date and time are available, consider the current date as shipping date and time
- In a new column named **Shipping management**, use a function to show, for each sale:
 - The text string «Excellent handling» if the shipment started in 48 hours or less
 - An empty cell if the shipment started in 48 to 96 hours
 - The text string «Bad handling» if the shipment started in 96 hours or more

Our second case

- In a new column named **Day check**, use a function to show, for each sale:
 - The text string «Weekend sale» if the sale was on a Sunday or on a Saturday
 - An empty cell in all other cases
- Apply a format to the cells of the **Revenue** field so that the cells corresponding to sales made after 1/1/2025 and with a revenue greater than or equal to 500 euros are automatically highlighted with a fill color of your choice
- Apply a format to the cells of the **Product** field so that the cells corresponding to sales made between 10:00 AM (included) and 12:00 PM (not included) are automatically highlighted with a fill color of your choice

Our second case

- In a new worksheet named **Analysis**, create a table to calculate the total revenues for each category, considering only the sales carried out between 1/10/2025 and 1/20/2025 (both inclusive). Then sort the categories, in the **Analysis** worksheet, in ascending order.

Tools to learn with today's lecture

- Formulas with dates and times
- Date & Time functions: DAY, MONTH, YEAR, HOUR, MINUTE, SECOND, WEEKDAY, TODAY, NOW, DATE, DATEDIF
