Lesson 10

Lookup & Reference functions

Università
Bocconi
MILANO

Objectives of the lesson

- Understand how to use Lookup & Reference functions
- Learn how to use the data validation tool
- Understand how to use IFERROR function
- Learn how to protect files, worksheets and single cells

Our first case

The **Orders** worksheet contains a list of orders where three of the fields have some missing data. We need to complete the table with the missing quantities, the unit prices and the discounts. We therefore need to:

- Use the Data validation tool to set validation rules for the values to enter in the **Quantity** column of the **Orders** worksheet (whole numbers only, in the range from 1 to 10,000). Move then to the **Data** worksheet to set validation rules also in the **Discount** column (decimals only, in the range from 0 to 0.9)
- Use a function to show, in the **Unit price** column of the **Orders** worksheet, the unit price of each product based on data available in the **Data** worksheet
- Use then a function to show, in the **Discount** column, the discount to apply to each order based on the quantity, using values available in the **Data** worksheet

Our second case

The **Products** worksheet contains a list of orders received by a food and beverage wholesaler. We need to:

- Create, in a new worksheet named **Analysis**, a tool to show some information on a specific order to be selected among the ID's present in the **Lists** worksheet using a drop-down list
- Create, in the **Analysis** worksheet, another tool to show the average quantity for orders with destination Milan, based on a category selected from a drop-down list
- Use protection tools to protect the Analysis worksheet and the workbook

Tools to learn with today's lesson

- Data validation
- Lookup & Reference functions: VLOOKUP, MATCH
- IFERROR function
- Data protection in Excel
